

FOR ELEVATOR AND ESCALATOR SERVICE COMPANIES

RiseLynk

The offline-first maintenance platform. Field app, office console, customer portal, and Lynk AI in one system that keeps working where your mechanics actually work.

See it in action demo.app.riselynk.com

Elevator work happens where software dies

Machine rooms, hoistways, and parking garages are dead zones. Generic field service apps were built for signal, and the paperwork this trade carries was never their problem.

32,679

US elevator installation and service businesses, in a \$54.9B market (IBISWorld, 2025). Most run on generic tools, spreadsheets, or paper.

No signal, no app

Cloud apps stall in the pit and the penthouse. Work gets retyped later or lost.

Phone tag

Trouble calls land in voicemail. The callback waits while the message gets relayed.

Paper tickets

Time, parts, and photos live on paper until someone retypes them. Billing leaks.

Compliance scramble

Cat-1 and Cat-5 tests sit in spreadsheets until an inspector asks for them.

One system from trouble call to paid invoice

Field app

Offline-first app your mechanics run on any phone. Tickets, time, parts, photos, tests.

Office console

Dispatch, routes, proposals, invoicing, and payroll on one screen for the branch.

Customer portal

A QR code in the lobby. Building managers report trouble in seconds, no login.

Lynk AI

Troubleshooting help in the field and a working assistant for the office.

Trouble call

Dispatch

Work offline

Sync

Invoice

Every piece talks to the same system, so nothing gets retyped and nothing falls between the truck and the office.

The field app works with no bars

Nothing is lost to a dead zone.

Every save lands on the device first. When signal returns, a three-way merge sync brings it home without clobbering anyone else's work.

Capture it once, in the pit, on the ticket.

Time, parts, and photos with no signal

Captured on the ticket offline. Photos upload when you're back in coverage.

Routes your mechanics control

Reorder stops by hand or tap once to optimize by proximity and live traffic.

Cat-1 and Cat-5 test capture

State test forms filled on the device and exported as PDFs, even offline.

Pay buckets that match the agreement

Time lands in the right IUEC pay bucket as it's logged, not at payroll time.

Messaging built in

Branch channel, direct messages, and threads anchored to the ticket.

The office types nothing twice

Live dispatch with entrapment alerting

A live board by mechanic. Entrapments surface loud and first.

Ranked assignment suggestions

Ranked by shift, proximity, and load. The dispatcher stays in charge.

Month route builder

Schedule-aware auto-packing builds the month, then you publish it.

Proposal pipeline

Mechanic recommendations become proposals, sent and tracked to accepted.

Invoices from unbilled work

Drafted straight from logged time, parts, and expenses. Per-account rates and tax.

Roster and payroll

Schedules, roles, home bases, and salaried payroll in the same console.

Customers report trouble in seconds

A QR code posted in the building lobby replaces phone tag. The building manager scans it and logs a trouble call in seconds. No app to install, no password to forget.

Entrapment fast path

A reported entrapment routes straight to the branch phone, not a queue.

Tokenized per building

Each building gets its own link. No shared logins to manage or revoke.

Account managers see more

Service history, payment records, messages, and Ask Lynk for quick questions.

1

Scan the code in the lobby

2

Describe the problem, add a photo

3

The branch sees it instantly

Lynk knows the trade, not just the chat

Troubleshooter

Help on the controller your mechanic is standing in front of, mid-callback.

Test procedures

Controller-specific procedures for the test you're about to run.

Office assistant

Looks up accounts, tickets, and invoices for the office in plain language.

Form mapper

Washington forms today. Other states are mapped as data during onboarding.

Lynk proposes. Your office approves. AI never finalizes work, billing, or compliance on its own.

Your test records, ready when you need them

Washington L&I today

Cat-1, Cat-5, and section 2.19 tests captured on the state's own forms.

Filled PDFs, even offline

The signed test comes off the device as a filled state form, no retyping.

Forms as data

New jurisdictions are templates to load, not software rewrites to wait for.

A maintenance agent that watches test dates

It watches each unit's test due dates and files suggestions for office review.

Demo data is real

The demo runs on genuine Washington State conveyance records, including real overdue test dates. Bring your own state's forms and we'll map them.

Inspection paperwork is the wedge that wins the deal.

None of this is a code-compliance certification. RiseLynk is not the inspector or the authority having jurisdiction.

Why not a generic field service app?

	Generic field service apps	Legacy elevator suites	RiseLynk
Built for elevator work	No, generic trades	Yes	Yes
Works with no signal	Limited offline modes	Rarely	Offline-first by design
State test forms (Cat-1, Cat-5)	No	Varies	Filled PDFs, even offline
AI assistant	Add-on, extra cost	No	Built in
Your data	Shared multi-tenant	Shared or on-prem	Own isolated database

Small platform, serious engineering

1

isolated database per company. Your data never shares a tenant with another shop.

200+

automated tests run before changes ship, covering sync, billing, and payroll math.

100%

of tables enforce row-level security. Access is checked at the database, not the app.

Proven

backup and restore, exercised by automated drills, not assumed.

Put through an adversarial security review this year, with every finding remediated. GDPR and CCPA data tools are built into the office console, not bolted on.

Built for independent shops

RiseLynk fits elevator and escalator service companies running roughly 2 to 50 mechanics: the shops the big platforms price out and the generic apps let down.
